

# PyAEDT Script Launcher

Carlos A. Mulero Hernández, Ph.D.

# / Installing

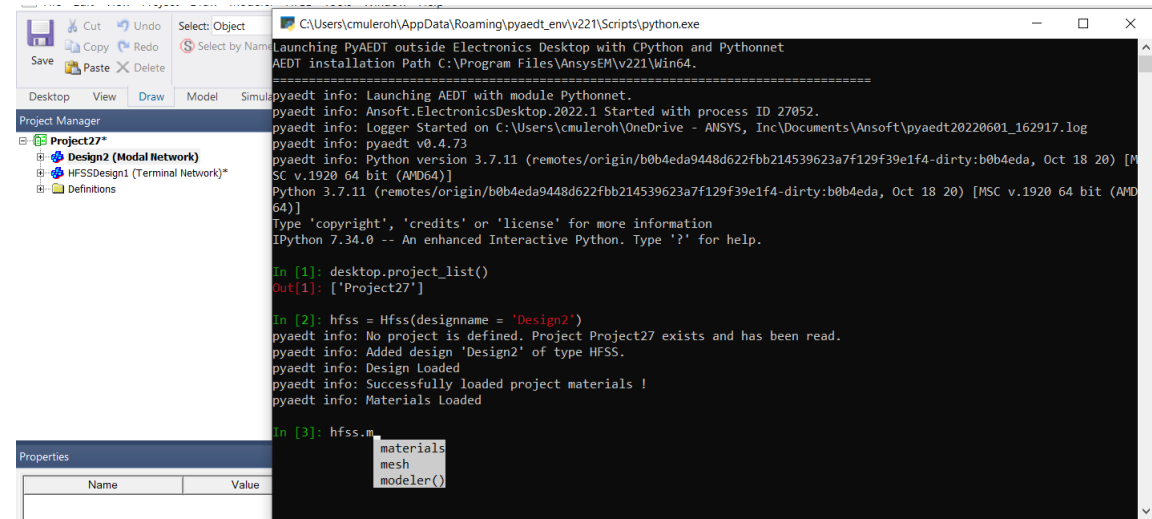

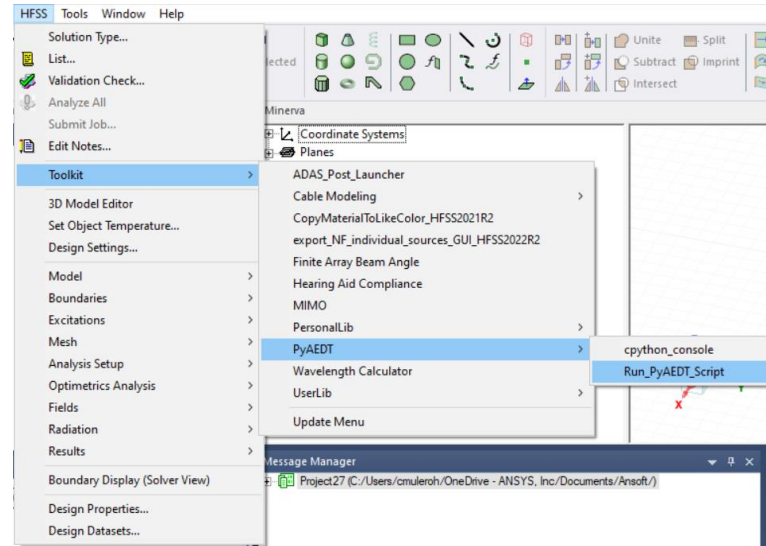

- Double-Clicking batch file launches installer
  - Command line interface, only requires 1 manual answer to choose a version to install for
  - By default uses bundled python (3.7)
    - Virtual environment created at %appdata% and various libraries installed
  - Can be pointed at particular python install using -p flag from a cmd line call
- Pulls files from online repositories for installation so it **might take a few minutes**

```
C:\WINDOWS\system32\cmd.exe
[1]2022 R2
[2]2022 R1
[3]2021 R2
[4]2021 R1
Select Version to Install PyAEDT for (number in bracket):
```

# Features

- Installed launcher can be used to directly launch scripts
  - Added code in PyAEDT scripts can allow referencing the launching AEDT instance
- CPython Console is an interactive console
  - similar to the IronPython Command window found in the tools menu
  - Includes tab-drop-down for possible auto-completes
  - Some **colors**
- Installed for all Design types

## Some details:

```
13 Author: Carlos A. Mulero Hernandez
14 """
15 import ...
16 clr.AddReference('System.Windows.Forms')
17 from System.Windows.Forms import OpenFileDialog
18
19 import os
20 import subprocess
21
22 oProject = oDesktop.GetActiveProject()
23 oDesign = oProject.GetActiveDesign()
24 #choose file to launch
25
26 file_dialog = OpenFileDialog()
27 file_dialog.InitialDirectory = oProject.GetPath()
28 file_dialog.Filter = "python files(*.py)|*.py"
29 ret = file_dialog.ShowDialog()
30 print "ret: "+repr(ret)
31

41         command = [
42             python_exe,
43             pyaedt_script,
44             str(oDesktop.GetProcessID()),
45             oDesktop.GetVersion()[0:0], # "2022.1.0" is returned but this makes PyAEDT fail a float conversion
46         ]
47         subprocess.Popen(command)
48     else:
49         # exit()
50         print "ret didn't pass the equivalence"
51         print "ret: "+repr(ret)
52 except Exception as e:
53     print e
```

```
18 #####
19 # Launch AEDT in Graphical Mode
20 # #####
21 # This examples launches AEDT 2022R1 in graphical mode.
22 process_id = sys.argv[1]
23 version = sys.argv[2]
24 with hfss( specified_version= version,
25            aedt_process_id = process_id,
26            new_desktop_session=False,
27            non_graphical=False,
28            ) as hfss:
29     hfss.change_material_override(True)
30     hfss.change_automatically_use_causal_materials(True)
31     hfss.create_open_region("100GHz")
32     hfss.modeler.model_units = "mil"
33     hfss.mesh.assign_initial_mesh_from_slider(applycurvilinear=True)
34
35 #####
36 # Input variables
37 # #####
38 # This examples creates a flex cable based on the following variables.
39 total_length = 300
40 theta = 120
41 r = 100
42 width = 3
43 height = 0.1
44 spacing = 1.53
```

- The launcher passes information about the current AEDT instance as command line arguments allowing the script to run **on the launching session**

# Previous Solutions and My Script

- **Manual Install:** Download Python, pip install PyAEDT, execute .py files
  - Seems to leave many wanting more guidance.
  - PyAEDT examples can run by just clicking on them
  - Cumbersome when user doesn't have all the permissions on their account
- **Existing Solution:** `pyaedt_with_ide.bat` is available at <https://aedtdocs.pyansys.com/Resources/Installation.html> and downloads PyAEDT
  - Uses Python3.7 that is already bundled with AEDT
  - Creates Virtual environment to isolate the installation with AEDT
  - Bypasses need for administrator privileges by writing to %APPDATA%
  - Single file installs PyAEDT and launches a scripting IDE
  - Launches Spyder or Jupyter which might be intimidating for some users
  - File association isn't made so user still needs to return to the .BAT for an IDE/cmd line to launch PyAEDT Scripts
- **My Script:** same installation as the above solution, but creates a launcher instead of requiring an IDE or command line interface
  - Creates a console that points the AEDT session that spawned it with a desktop variable pre-defined
  - Creates a Launcher with a GUI FilePicker that allows running PyAEDT Scripts using the Python3.7 virtual environment
  - One file does the installation
  - Easy to send a customer a script they can run from HFSS
  - File Association isn't made so user needs to use the Launcher to run PyAEDT scripts
  - Workaround still needed for customers who don't have admin rights

 **Ansys**
